PROFESSIONAL SUMMARY

Detail-oriented Computer Science & Engineering student specializing in AI/ML, combining strong data engineering capabilities with a product-driven mindset. Proven experience building and validating predictive ML models, designing cloud-backed data solutions, and managing end-to-end project workflows. Adept at translating complex data analytics into actionable insights that drive process optimization, automation, and cross-functional collaboration — with hands-on exposure to AWS, GCP, and Oracle Cloud platforms.

TECHNICAL SKILLS

Data Analytics & Visualization: Python (Pandas, NumPy), SQL, Matplotlib, Data & Metric Tracking, Dashboarding & Reporting

AI & Machine Learning: Machine Learning Algorithms, Deep Learning, NLP, Predictive Modeling, Model Validation, Workflow Automation, Scikit-Learn

Data Engineering & Cloud: Data Pipelines, AWS (Technical Essentials), Google Cloud Platform (GenAI), Oracle Cloud Infrastructure (Data Science), Internet of Things (IoT), Embedded Systems

Product & Management Concepts: End-to-End Product/Project Delivery, Requirement Gathering, Stakeholder Communication, User Workflow Analysis

Languages & Tools: Python, C++, Java, SQL, Git, Jupyter Notebook, Django

PROJECTS

HydroSense | *EPICS Community Project — ML Integration Contributor*

Python, XGBoost, ML Pipelines

- Connected the trained predictive model (XGBoost) to the frontend application, enabling real-time crop recommendations from live environmental sensor data.
- Worked with XGBoost model outputs and input data handling, structuring the prediction flow between the ML pipeline and the user-facing interface.
- Helped design output visualization logic in the UI, translating raw model predictions into clear, actionable insights for end users.
- Participated in iterative testing and validation cycles to improve model accuracy and overall system functionality.

Vehicle Management System | *Backend Development*

Python, Django, SQL

- Developed the backend of a vehicle management system using Django (Python), mapping complex vehicle and driver workflows into a scalable data model.
- Designed and built data reporting and CRUD modules (vehicles, drivers, maintenance) enabling stakeholders to track asset metrics and generate actionable insights.
- Implemented maintenance scheduling logic with automated reminders and fuel-log tracking, aligning backend architecture with core business requirements.
- Built user authentication and role-based access control, supporting a secure, production-style backend workflow from requirements through delivery.

EDUCATION

B.Tech, Computer Science & Engineering — AI & ML | *Vellore Institute of Technology (VIT Bhopal)*

Sept 2023 – Present

- CGPA: 8.39
- Relevant Coursework: Machine Learning, Deep Learning, Natural Language Processing, Data Structures & Algorithms, Cloud Computing, Statistical Inference, Computer Vision.

CERTIFICATIONS

- Applied Machine Learning in Python** – University of Michigan — Machine Learning, Scikit-Learn, applied model building
- Introduction to Internet of Things** – NPTEL — IoT architectures and Embedded Systems
- Google Cloud Generative AI** – Google — Generative AI fundamentals & foundational model implementation on GCP
- AWS Technical Essentials** – Amazon Web Services — Core cloud services, networking, and architecture
- OCI Data Science** – Oracle Cloud Infrastructure — Cloud-based data science and ML workflows
- Cloud Computing** – Foundational cloud architecture and deployment models
